# 1.0 INTRODUCTION

Starlight Investments (the Client) intends to redevelop the property located at 1637 – 1645 Bathurst Street, Toronto, Ontario, M5P 3J6, (hereafter referred to as 'the Site'). McClymont & Rak Engineers Inc. (MCR) was retained to conduct a Geohydrology Assessment for the Site to evaluate the requirements for temporary and permanent dewatering for the proposed redevelopment.

# 1.1 SCOPE OF WORK

The objectives of the Geohydrology Assessment are to determine the following:

- Hydrogeological conditions of the Site, including the groundwater and phreatic surface, subsurface elevations and flow patterns and the interaction with the design and construction of the proposed development.
- Reviewing the available background information for the Site obtained from MCR's files, City of Toronto, and architectural drawings.
- Estimate the potential temporary dewatering flow rates during construction and assessment of potential impacts on the surrounding environment.
- Estimate the long term flow rates from the Private Water Drainage System (PWDS) of the proposed building.
- Assess the permitting requirements for both dewatering and discharge with the Ministry of Environment, Conservation and Parks (MECP) and the City of Toronto – Toronto Water (the City), respectively.
- Summarize the findings in a Geohydrology Assessment Report.

# **1.2** SITE DESCRIPTION

The subject property is located at the municipal address 1637 - 1645 Bathurst Street, in a predominantly residential area of the City of Toronto, Ontario. The site is rectangular in shape with a total area of approximately 4,161 m<sup>2</sup>.

The Site is bounded by residential buildings to the north, east, and south and Bathurst Street to the west. The Site is occupied by five 3-storey apartment

buildings, a paved entrance from Bathurst Street to the west side of the buildings and a paved driveway along the east side.

The ground surface on the west side of the buildings is landscaped, covered with grass and some trees and bushes. There are fences on the south and east sides, and wire fence on the north side.

The paved surfaces are even, while landscaped parts are made with irregular slopes and flatter areas. Terrain slopes towards the north and east with the maximum difference in borehole elevations of 2.6 m. There is a retaining wall along Bathurst Street extending from the entrance driveway all the way to the south end of the property.

The legal description of the Site is: Lots 4 to 10 Inclusive, Plan M-347, City of Toronto. A Site Survey Plan is enclosed in Appendix A.

## 1.3 **PROPOSED DEVELOPMENT**

The Site is proposed for residential redevelopment consisting of a four [4] storey building with two [2] levels of below grade parking (Appendix B). It is understood that the finished floor elevation (FFE) at ground will be range from approximately 170.65 to 174.75 meters above sea level (masl). The P2 lower FFE will be at an approximate elevation of 163.34 masl.

Presently, it is assumed that the proposed building can be supported on conventional spread/strip footings. The size of the shoring plan layout was assumed to cover approximately 84 m by 32 m.

A conventional sub-floor Private Water Drainage System (PWDS) with perimeter weeping tile below the P2 Level slab will be required. A soldier pile and lagging wall shoring system will be sufficient for the Site except where adjacent structures exist, where a caisson wall will be utilized.

### 1.4 **PROPERTY OWNERSHIP**

The Site is commissioned by Starlight Investments, and the owner is represented

by Mr. Evan French, with the following contact information:

Starlight Investments 1400 – 3280 Bloor Street West, Centre Tower Toronto, Ontario M8X 2X3

Mr. Evan French Development Manager E-mail: <u>efrench@starlightinvest.com</u>

# 1.5 REVIEW OF PREVIOUS REPORTS

The following geo-environmental reports were provided for review prior to initiating the investigation:

• MCR report titled, *Geotechnical Report, Proposed Residential Development, 1637 – 1645 Bathurst Street, Toronto, Ontario,* prepared for Starlight Investments, dated August 2017.

# 2.0 HYDROGEOLOGICAL CONDITIONS

### 2.1 PHYSICAL SETTING

The Site is located in the north-central portion of the City of Toronto and is situated in a predominantly residential area. There are no areas of natural significance within 250 m. There are no water bodies or areas of natural significance within 30 m of the Site boundaries. The nearest surface water body is the Don River, at approximately 4.6 km south-east of the Site.

The Site is located at an average geodetic elevation of approximately 170 masl and the topography across the Site is generally flat with a gentle slope towards the south.

The Site is bounded by the following properties/features:

North	Residential Buildings
South	Residential Buildings
East	Residential Buildings
West	Bathurst Street

### 2.2 TOPOGRAPHY

According to the topographic map, Map 30 M/11, 9<sup>th</sup> Edition published by Government of Canada; Natural Resources Canada; Earth Sciences Sector; Canada Centre for Mapping and Earth Observation, on July 19, 2013, the ground surface at the Site is relatively flat with the surrounding area sloping gently to the south towards Lake Ontario.

### 2.3 REGIONAL GEOLOGY AND HYDROGEOLOGY

According to the geological map entitled "Quaternary Geology of Ontario, Southern Sheet" Map 2556, published by the Ontario Ministry of Development and Mines, dated 1991, the overburden in the study area consists of predominantly silt to silty clay matrix, high in matrix carbonate content and clast poor. The groundwater typically tends to flow towards south-east, towards the Don River.

According to Ontario Ministry of Development and Mines, Map No. 2544, "Bedrock Geology of Ontario, Southern Sheet, 1991", the bedrock typically consists of Upper Ordovician shale, limestone, dolostone and siltstone. Groundwater tends to flow towards south-east, towards the Don River.

### 2.4 LOCAL GEOLOGY AND HYDROGEOLOGY

On a local scale, geological conditions and hydrogeology are similar to the ones at a regional scale. Locally, near surface groundwater flow may be influenced by underground structures (e.g., service trenches, catch basins, and building foundations or surface watercourses). No surface water features are present onsite and there are no Provincially Significant Wetlands in the vicinity of the Site.

# 3.0 SCOPE OF INVESTIGATION

### 3.1 OVERVIEW OF SITE INVESTIGATION

- The field investigation included the advancement of three boreholes (BH1 to BH3) by MCR from June to August 2017.
- The boreholes were advanced to depths ranging from 12.45 to 12.65 m. Boreholes 1 and 2 were equipped with monitoring wells for long term groundwater monitoring.
- The borehole locations are shown in Drawing No. 1 and the borehole logs are presented in Appendix C.
- Groundwater levels were recorded from all available monitoring wells over various dates and the data is presented in Table 1.
- Groundwater samples were collected from BH1 for chemical analysis of the City of Toronto Sewers By-Law criteria.

### 3.2 MONITORING WELL INSTALLATION

All monitoring wells by MCR were installed with a 50 mm diameter schedule 40 PVC pipe and a 3.05 m long slotted well screen. Well screens were surrounded by a silica sand pack to at least 0.6 m above the top of screen with a bentonite seal extending from above the sand pack to within 0.5 m of the ground surface. All monitoring wells were completed with a flush mounted cover at ground surface. Monitoring well installation was done in accordance with the *Ontario Water Resources Act*, Sections 35 to 50.

### 3.3 ELEVATION SURVEYING

The elevations for all MCR boreholes were surveyed and referenced to a metric and geodetic system. Borehole elevations are shown on the borehole logs in Appendix C.

# 3.4 GROUNDWATER SAMPLING

All groundwater sampling activities were conducted in accordance with Ontario

Regulation (O.Reg.)153/04, as amended to O.Reg.511/09, July 2011. All monitoring wells were developed prior to sampling activities using a Waterra Hydrolift II (HL-1217) inertial lift pump by purging at least three well volumes or until the monitoring well was purged dry. Groundwater samples were obtained at least 24 hours' post-development under static conditions.

## 3.5 GROUNDWATER ANALYSIS

All groundwater samples were submitted to ALS Laboratory Group (ALS) of Richmond Hill, Ontario, certified by the Canadian Association for Laboratory Accreditation (CALA), for chemical analysis. The Certificates of Analysis received are included in Appendix D. The contact information for the laboratory used is included below.

### **ALS Laboratory Group**

95 West Beaver Creek Road Richmond Hill, ON L4B 1H2

Groundwater samples were submitted for bulk chemical analysis for the criteria provided in the *Toronto Municipal Code, Chapter 681, Sewers By-law.* The results of chemical analysis were compared to the criteria provided in *Table 1 – Limits for Sanitary and Combined Sewers Discharge and Table 2 – Limits for Storm Sewer Discharge.* These guidelines establish the maximum allowable concentrations of specific analytical parameters for water discharged into either the municipal sanitary and/or storm sewer system respectively.

# 4.0 INVESTIGATION RESULTS

# 4.1 GEOLOGY

Ground surface elevations at boreholes ranged from 171.95 (BH 2) to 174.55 masl (BH 3). Based on the investigation, the geologic formations beneath the Site are illustrated in the borehole logs (Appendix C) and include the following (from surface to depth):

**Asphalt/Granular Fill:** An asphalt layer, about 75 mm in thickness was present at the ground surface of borehole 1.

**Miscellaneous Fill:** Fill, consisting of silty sand and clayey silt with some sand and gravel, was detected below the asphalt layer in borehole 1 and at the surface of boreholes 2 and 3. The fill extended to depths ranging from 0.75 to 1.50 m. The brown, moist, stiff/compact, fill also contained traces of organics, rootlets and construction debris such as brick pieces.

Due to the nature of fill and for the purpose of offsite disposal, the type/quality and extent of the existing fill should be explored by further test pit investigation.

**Sandy Silt Till:** Compact to very dense sandy silt to sandy silt till deposit was encountered below the fill and extended to the maximum depth of investigation in all boreholes. The brown to grey, moist to wet deposit contained layers of hard, moist to wet clayey silt to clayey silt till. They clayey silt to clayey silt till was very dense and contained wet silty sand and trances of clay and gravel.

# It should be noted that the till/sand soil is an unsorted sediment; therefore, boulders and cobbles are anticipated.

**Groundwater:** Upon competition of drilling, groundwater was observed at depths of 11.30 and 11.00 m in boreholes 2 and 3, respectively. Borehole 1 remained dry.

On July 21, 2017, groundwater was measured at a depth of 6.23 m in borehole

1. The results are summarized on the Record of Borehole Sheets in Appendix C and Table 1.

## 4.2 GROUNDWATER LEVEL MONITORING

Groundwater levels were monitored by MCR in BH1 to BH2 during 2017. All groundwater measurement data is presented in the enclosed Table 1. It should be noted that groundwater levels are subject to seasonal fluctuations. All groundwater levels were manually measured using an electric water level meter and with respect to geodetic borehole elevations. The monitoring wells must be decommissioned, prior to construction, in accordance with Regulation 903 by a qualified contractor.

The interpreted groundwater flow direction is based on the 2017 round of water table elevation measurements, since this event provided water table elevations from the majority of the monitoring wells. Confidence in the groundwater flow direction could be increased with additional rounds of water table elevation measurements. The interpreted local direction of hydraulic movement across the Site is inferred to be in a south-eastern direction, towards the Don River.

# 4.3 **GROUNDWATER QUALITY**

Groundwater samples collected in August 2017 from BH1 were analyzed for the City of Toronto Sewers By-Law criteria. The results of chemical analysis (Table 2) indicate that the sample complies with both the *Table 1 Limits for Sanitary & Combined Sewers Discharge* and the *Table 2 Limits for Storm Sewer Discharge* for all parameters analyzed.

# 4.4 GROUNDWATER DISCHARGE ASSESSMENT

Presently, the groundwater sample collected onsite can be discharged to the City sanitary and combined sewer system or storm sewer system with no additional filtration or treatment.

# 5.0 REVIEW AND EVALUATION

#### 5.1 TEMPORARY DEWATERING ASSESSMENT

The excavation for the proposed two underground parking structure will extend into competent native silty clay/sandy silt till. In order to protect the sides/bottom of the excavation from being disturbed by excess groundwater pressure, i.e. to prevent quick sand/dilating silt conditions, the groundwater table must be lowered at least 2.0 m below the bottom of the footing excavation. Positive dewatering such as eductors will be required for the proposed excavation. Onsite soils might be subject to localized piping during dewatering. Creation of piping channels may result in substantial increase in the volume of both temporary dewatering and permanent drainage.

For the proposed two underground levels, groundwater is required to be drawn down a minimum of 2 m below the underside of the footing. The assumed footing elevation is 161.84 masl, therefore, groundwater will need to be lowered to an elevation of approximately 159.84 masl. The average ground water level recorded in the monitoring wells is conservatively taken at an elevation of 167.27 masl (Table 3), representing an approximate 7.40 m hydrostatic head requiring dewatering. The report has not conducted dewatering induced settlement calculations.

Theoretically, the groundwater drawdown for a single well pumping can be described as:

$$Q = -2\pi r K h \frac{dh}{dr}$$
(1)

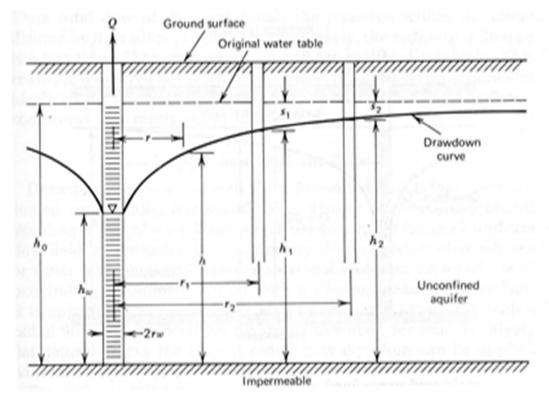

And further we have:

$$h^{2} = -\frac{Q}{\pi K} \ln(r / r_{w}) + h_{w}^{2}$$
<sup>(2)</sup>

Where:

*h* [*m*] is the height of the water table above an impervious base Q [*m*<sup>3</sup>/day] is the rate of pumping discharge

*K* [*m*/day] is hydraulic conductivity *R* [*m*] is the radius from the centre of well location *r<sub>w</sub>*[*m*] is the radius of pumping well (see Schematic A below).

Schematic A: Radial flow to an unconfined aquifer (Todd 1980)

# 5.1.1 Numerical Analysis

The abovementioned Site parameters were used to calculate the estimated steady state discharge rate for temporary construction dewatering. Groundwater monitoring data is presented in Table 3. The calculations for temporary dewatering rates are shown in Table 4.

From the observed soil types and based on soil sample descriptions (*Todd, 1980; Mays, 2001; and Craig, 2004*), the average hydraulic conductivity (K) of the aquifer was estimated at 0.5 m/day. The estimated steady state discharge rate for temporary construction dewatering was calculated to be approximately 192 m<sup>3</sup>/day (35 USG/min) with a safety factor of 1.50.

The initial drawdown pumping rate would be higher to relieve the stored

groundwater pressure (prior to the start of construction). Considering the soils onsite being mainly a mixture of clayey silt/sandy silt, the average specific yield is estimated as 10%. The total yield from the groundwater stored within the soil pore would be about 2,000 m<sup>3</sup>.

The additional discharge rate to remove the groundwater store in the pore spaces during initial drawdown could range form 50 m<sup>3</sup>/day for a 40-day drawdown period to 33 m<sup>3</sup>/day for a 60-day drawdown period. A factor of two should be applied to account for unforeseen conditions, including potential impact of wet weather conditions and fluctuations in the groundwater table.

Additional pumping may be required to remove surface water from the Site. Assuming a rainfall event of 25 mm over a 24 hour period, about 67 m<sup>3</sup>/day of water may need to be removed from the Site following rain events.

	Typical	Maximum	Units
Groundwater	192	292	m³/day
Precipitation	0	67	m³/day
Total	192	359	m³/day

Accordingly, the following pumping rates are required:

# 5.2 PERMANENT FOUNDATION DRAIN FLOW RATES

For the proposed redevelopment, it is understood that the ground floor's FFE will range from approximately 170.65 to 174.75 masl. The P2 lowest slab's finished floor will be at an approximate elevation of 163.34 masl.

A conventional sub-floor Private Water Drainage System (PWDS) with perimeter/under floor weeping tile is proposed below the P2 level slab. The invert of the PWDS is assumed to be at an approximate elevation of 162.84 masl.

The proposed PWDS is shown on Drawing No. 2. The slotted pipes should slope to a sump at a minimum 1% slope. Perimeter drainage pipes, with a positive gravity outlet, should be solid PVC with a minimum of 0.5% slope. In addition, silt traps must be provided at convenient/accessible locations.

### 5.2.1 Numerical Analysis

The abovementioned Site parameters were used to calculate the estimated steady state discharge rate for the PWDS. Groundwater monitoring data is presented in Table 3. The calculations for permanent drainage flow rates are shown in Table 5.

From the observed soil types and based on soil sample descriptions (*Todd, 1980; Mays, 2001; and Craig, 2004*), the average hydraulic conductivity (K) of the aquifer was estimated at 0.5 m/day. The estimated steady state discharge rate for the PWDS was calculated at approximately 91 m<sup>3</sup>/day (17 USG/min).

# 5.3 MECP PERMIT TO TAKE WATER REQUIREMENT

The Permit to Take Water (PTTW) requirements for construction site dewatering have been updated to the current O.Reg.63/16 amendment to Environmental Protection Act. In accordance with the updated regulation, construction site dewatering will require a complete PTTW application when water takings greater than 400,000 L/day are predicted. Groundwater taking between 50,000 L/day and 400,000 L/day will require a limited PTTW via an online application process through the Environmental Activity and Sector Registry (EASR). Groundwater taking from a proposed building structure by means of a PWDS will require a PTTW when water taking is greater than 50,000 L/day. The complete permit application process for PTTW takes approximately twelve weeks to review and is required prior to applying for the discharge permits.

The maximum anticipated temporary dewatering discharge rate was calculated at approximately 359 m<sup>3</sup>/day. Therefore, a limited PTTW application will be required to be applied for with the MECP.

The flow rate from the PWDS was calculated at approximately 91 m<sup>3</sup>/day. Therefore, a complete PTTW application for the PWDS will be required for the proposed building.

In accordance with the current Ontario Regulation 387/04 for Water Taking, every person to whom a permit has been issued under Section 34 of the Act

shall collect and record data on the volume of water taken daily. The data collected shall be measured by a flow meter or calculated using a method acceptable to a Director.

### 5.4 TORONTO WATER DISCHARGE PERMIT REQUIREMENTS

The City of Toronto – Toronto Water requires that any private water to be discharged into the City sewer system must have a permit or agreement in place in order to discharge; this applies to all water not purchased from the City water supply. For temporary dewatering during the construction phase, this includes all groundwater and storm water that is collected or encountered during site excavation. For the PWDS, this includes all groundwater that is constantly pumped as a result of the drainage system elevation located below the groundwater table elevation or through storm water infiltration.

The groundwater quality sample collected in 2017 indicated that the water onsite could be discharged into the City sanitary and combined sewer system or storm sewer system without additional filtration/treatment required. A short-term temporary discharge permit must be applied for construction dewatering with Toronto Water.

A long-term permanent discharge permit must be applied for the proposed PWDS since the drainage system is located below the long-term groundwater elevation. The permanent discharge permit will involve coordination with the mechanical and site servicing consultant to provide calculations and drawing specifications for the ultimate discharge location and the sampling port required by Toronto Water.

### 5.5 Environmental Protection

The Site is located within the Don River drainage basin and the lake is approximately 4.6 km south-east of the Site. There are no surface water features and no areas of natural significance or provincially significant wetlands in the vicinity of the Site. The Site is located in the City of Toronto urban environment which obtains its municipal water supply from Lake Ontario. Therefore, there are no potable groundwater users within the vicinity of the Site.

The proposed redevelopment plan will remove all the overburden to a depth of approximately 9 - 13 mbgs, from the interior Site area shown on the Site plan. Temporary groundwater dewatering will lower the groundwater table to below the underground parking foundations levels. The extracted water will be discharged into the sanitary sewer or into the storm sewer. Updated groundwater monitoring will be conducted by the dewatering contractor prior to and during construction activities to ensure that no additional adverse groundwater impacts are identified throughout the project's construction.

## 6.0 CONCLUSIONS AND RECOMMENDATIONS

McClymont & Rak Engineers Inc. was retained to conduct a Geohydrology Assessment for the Site in relation to the proposed redevelopment. The Site is occupied by five 3-storey apartment buildings, a paved entrance from Bathurst Street to the west side of the buildings and a paved driveway along the east side.

The Site is proposed for residential redevelopment consisting of a four [4] storey building with two [2] levels of below grade parking (Appendix B). It is understood that the finished floor elevation (FFE) at ground will be range from approximately 170.65 to 174.75 meters above sea level (masl). The P2 lower FFE will be at an approximate elevation of 163.34 masl.

Presently, it is assumed that the proposed building can be supported on conventional spread/strip footings. The size of the shoring plan layout was assumed to cover approximately 84 m by 32 m.

A conventional sub-floor Private Water Drainage System (PWDS) with perimeter weeping tile below the P2 Level slab will be required. A soldier pile and lagging wall shoring system will be sufficient for the Site except where adjacent structures exist, where a caisson wall will be utilized.

The excavation for the proposed two underground parking structure will extend into competent native silty clay/sandy silt till. In order to protect the sides/bottom of the excavation from being disturbed by excess groundwater pressure, i.e. to prevent quick sand/dilating silt conditions, the groundwater table must be lowered at least 2.0 m below the bottom of the footing excavation. Positive dewatering such as eductors will be required for the proposed excavation. Onsite soils might be subject to localized piping during dewatering. Creation of piping channels may result in substantial increase in the volume of both temporary dewatering and permanent drainage.

For the proposed two underground levels, groundwater is required to be drawn down a minimum of 2 m below the underside of the footing. The assumed footing elevation is 161.84 masl, therefore, groundwater will need to be lowered to an elevation of approximately 159.84 masl. The average ground water level recorded in the

monitoring wells is conservatively taken at an elevation of 167.27 masl (Table 3), representing an approximate 7.40 m hydrostatic head requiring dewatering. The report has not conducted dewatering induced settlement calculations.

The anticipated discharge rate for temporary construction dewatering was calculated between  $192 - 359 \text{ m}^3/\text{day}$  (35 - 66 USG/min). Therefore, based on the amended O.Reg. 63/16 to the Environmental Protection Act, a limited PTTW application through the EASR will be required from the MECP and a temporary discharge permit will be required from the Toronto Water.

The discharge rate for the PWDS was calculated at 91 m<sup>3</sup>/day (17 USG/min). A complete PTTW will be required from the MECP for the PWDS. A permanent drainage discharge permit will be required from Toronto Water since the drainage system will be installed below the long-term groundwater elevation.

Presently, the groundwater sample collected onsite can be discharged to the City sanitary and combined sewer system or storm sewer system with no additional filtration or treatment.

The application process, where a PTTW is required, can take at least three months for a review by the MECP and is required to be approved prior to applying for discharge permits. It is recommended that applications to Toronto Water for discharge permits be applied for at least three months prior to the required start dates. Applications are to be supported by drawings and calculations provided by the mechanical and the site servicing consultant and coordination is required amongst all disciplines. The information provided in this report can be relied upon by Toronto Water – Environmental Monitoring & Protection Unit (TW-EM&P) regarding the short and long term Sanitary Discharge Agreement applications for the Site.

### 8.0 STATEMENT OF LIMITATIONS

McClymont & Rak Engineers, Inc. (MCR) conducted the work associated with this report in accordance with the scope of services, time and budget limitations imposed for this work. The work has been conducted according to reasonable and generally accepted local standards for an environmental consultant at the time of the work. No other warranty or representation, expressed or implied, is included or intended in this report.

The work was designed to provide an overall assessment of the environmental conditions at the Site. The conclusions presented in this report are based on the information obtained during the investigation. The work is intended to reduce the client's risk with respect to environmental impairment. No work can completely eliminate the possibility of further environmental impairment on the Site.

It should be noted that subsurface conditions might vary at locations and depths other than those locations where borings, surveys or explorations were made by MCR. Other contaminants, not tested for in this work, may also potentially be present on the Site. Even with exhaustive investigation, it is not possible to warranty the Site will be free of contaminants. Should conditions, not observed during the work, become apparent, MCR should be immediately notified to assess the situation and conduct additional work, where required. The findings of this report are based on conditions as they were observed at the time of the work.

No assurance is made regarding changes in conditions subsequent to the time of the work. Remediation cost estimates is based on the available information. The estimated costs for remediation only represent the costs for the clean-up of known contaminants that have been identified during the work. Additional costs may be incurred as a result of other contaminants or areas of contamination identified by subsequent work.

Regulatory statutes are subject to interpretation. These statutes and their interpretation may change over time, thus these issues should be reviewed with appropriate legal counsel.

MCR relied on information provided by others in this report. MCR cannot guarantee the accuracy, completeness and reliability of the information provided by others, although MCR staff attempted to seek clarification on information provided and verifies authenticity, where practical.

The report and its attachments were prepared for and made available for the sole use of the client. MCR will not be responsible for any use or interpretation of the information contained in this report by any other party without the prior expressed written consent of MCR.

# 9.0 CLOSURE

In accordance with your request and authorization, McClymont and Rak Engineers Inc. completed this Geohydrology Assessment Report. This report presented the methodology, findings and conclusions of the investigation. The Statement of Limitations for all work performed as part of this investigation is included.

We trust that the information provided in this report is sufficient for your present requirements. Should you have any further questions, please do not hesitate to contact our office. Thank you for retaining McClymont & Rak Engineers, Inc. for this project.

Respectfully, McClymont & Rak Engineers Inc.

### **Reference Information**

P-T-COL-WT	Water	Total P in Water by Colour	APHA 4500-P PHOSPHORUS	
This analysis is carried ou after persulphate digestion			4500-P "Phosphorus". Total Phosphorus	is deteremined colourimetrically
PAH-EXTRA-WT	Water	Sanitary Sewer Use By-Law Additional PAH	SW846 8270	
PAH-SUM-CALC-WT	Water	TOTAL PAH's	CALCULATION	
Total PAH represents the Total PAH in terms of the			nple. Note that regulatory agencies and	criteria differ in their definitions of
PCB-WT	Water	Polychlorinated Biphenyls	EPA 8082	
PCBs are extracted from a are analyzed by GC/MSD		mple at neutral pH with aliquots of	dichloromethane using a modified separ	atory funnel technique. The extracts
PH-WT	Water	pH	APHA 4500 H-Electrode	
Water samples are analyz	zed directly by	a calibrated pH meter.		
Protection Act (July 1, 20	11). Holdtime f	or samples under this regulation is		nder Part XV.1 of the Environmental
PHENOLS-4AAP-WT	Water	Phenol (4AAP)	EPA 9066	
An automated method is red complex which is mea		•	ffered to pH 9.4 which reacts with 4AAP	and potassium ferricyanide to form a
SOLIDS-TSS-WT	Water	Suspended solids	APHA 2540 D-Gravimetric	
A well-mixed sample is fill four hours or until a const			r and the residue retained is dried in an c	oven at 104–1°C for a minimum of
TKN-WT	Water	Total Kjeldahl Nitrogen	APHA 4500-N	
Sample is digested to con by the instrument is propo	overt the TKN to the contribution of the contributication of the contribution of the contribution of the c	o ammonium sulphate. The ammo concentration of ammonium sulpha	nia ions are heated to produce a colour on the sample and is reported as TKN.	complex. The absorbance measured
VOC-ROU-HS-WT	Water	Volatile Organic Compounds	SW846 8260	
Aqueous samples are ana	alyzed by head	lspace-GC/MS.		
XYLENES-SUM-CALC- WT	Water	Sum of Xylene Isomer Concentrations	CALCULATION	
Total xylenes represents t	the sum of o-xy	ylene and m&p-xylene.		
ALS test methods may in	icorporate mod	difications from specified reference	methods to improve performance.	
Chain of Custody number	rs:			
15-611920

### **Reference Information**

#### **GLOSSARY OF REPORT TERMS**

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there. mg/kg - milligrams per kilogram based on dry weight of sample mg/kg wwt - milligrams per kilogram based on wet weight of sample mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight mg/L - unit of concentration based on volume, parts per million. < - Less than. D.L. - The reporting limit. N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory. UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION. Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Application of guidelines is provided "as is" without warranty of any kind, either expressed or implied, including, but not limited to fitness for a particular purpose, or non-infringement. ALS assumes no responsibility for errors or omissions in the information.

### Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

### Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

### Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.
